Subject: Clarify RF exposure limits and measurement methods at >6 GHz for WLANs

**Objective**  
Currently, in the WLAN 6 GHz band, ARPANSA's RF exposure limits are given as 20 W/m2 absorbed power density in Table 1 as Basic restrictions and  $55/(f\text{GHz}^{0.177})\text{W/m}^2$  incident power density in Table 5 as Reference levels.

Normally, measurement and evaluation should be conducted using the absorbed power density of basic restrictions, but the Radiocommunications Equipment (General) Rules 2021\_F2021C01207 only describes the measurement method of Incident Power Density in IEC TR 63170/ SA TR IEC 63170. Therefore, RF exposure is measured and evaluated by both Absorbed Power Density and Incident Power Density.

To simplify this issue, I would ask you to consider the following  
It is not very practical to measure Incident Power Density in the WLAN 6 GHz band with a 2 mm near-field electromagnetic field. For this reason, I propose the following measurement and evaluation methods 1) or 2).

1) Apply SA/SNZ TS IEC 63446 as the evaluation method for RF exposure in the WLAN 6 GHz band, and only measure and evaluate the absorbed power density, with the limit being 20 W/m2 as in Table 1 of ARPANSA. This is the same requirement level as RSS-102 issue 6 of Canada.

2) As an evaluation method for RF exposure in the WLAN 6 GHz band only, IEC/IEEE 62209-1528 shall be applied to measure and evaluate 10 g SAR as in <6 GHz, and the limit shall be extended to 2 W/kg (4 w/kg for limbs) in Table 1 of ARPANSA. However, Incident Power Density according to IEC TR 63170/ SA TR IEC 63170 shall also be measured and its value shall be for reference purpose. This is the same as the concept of OVER6G in the FCC's KDB388624 D02 v18r06.

In any case, I would like you to clarify the measurement method and evaluation criteria for RF exposure in the WLAN 6GHz band as soon as possible, and please publish them officially.

It is hoped that the above will be useful in measuring and evaluating RF exposure in the AS/NZ WLAN 6GHz band.

ARPANSA

Table 1. Basic restrictions for RF electromagnetic field exposure from 100 kHz to 300 GHz, for averaging intervals ≥ 6 minutes

| Exposure Scenario | Frequency Range  | Whole Body Average SAR (W kg <sup>-1</sup> ) | Local Head/Torso SAR (W kg <sup>-1</sup> ) | Local Limb SAR (W kg <sup>-1</sup> ) | Local S <sub>ab</sub> (W m <sup>-2</sup> ) |
|-------------------|------------------|--|--|--------------------------------------|--|
| Occupational      | 100 kHz – 6 GHz  | 0.4  | 10   | 20                                   | NA   |
|                   | >6 GHz – 300 GHz | 0.4  | NA   | NA                                   | 100  |
| General Public    | 100 kHz – 6 GHz  | 0.08   | 2  | 4                                    | NA   |
|                   | >6 GHz – 300 GHz | 0.08   | NA   | NA                                   | 20   |

Notes:

1. 'NA' signifies 'not applicable' and does not need to be taken into account when determining compliance.

2. Whole body average SAR is to be averaged over 30 minutes.

3. Local SAR and S<sub>ab</sub> exposures are to be averaged over 6 minutes.

4. Local SAR is to be averaged over a 10 g cubic mass.

5. Local S<sub>ab</sub> is to be averaged over a square 4-cm<sup>2</sup> surface area of the body. Above 30 GHz, an additional constraint is imposed, such that exposure averaged over a square 1-cm<sup>2</sup> surface area of the body is restricted to two times that of the S<sub>ab</sub> restriction.

Table 5. Reference levels for local exposure, averaged over 6 minutes, to RF electromagnetic fields from 100 kHz to 300 GHz (unperturbed rms values)

| Exposure Scenario | Frequency Range | Incident E-field Strength E <sub>inc</sub> (V m <sup>-1</sup> ) | Incident H-field Strength H <sub>inc</sub> (A m <sup>-1</sup> ) | Incident Power Density S <sub>inc</sub> (W m <sup>-2</sup> ) |
|-------------------|-----------------|---|---|--|
| Occupational      | 0.1-0.135 MHz   | ES  | ES  | NA   |
|                   | >0.135-10 MHz   | ES  | 10.8/f <sub>M</sub>   | NA   |
|                   | >10-30 MHz      | 1504/f <sub>M</sub> <sup>0.7</sup>                              | 10.8/f <sub>M</sub>   | NA   |
|                   | >30-400 MHz     | 139   | 0.36  | 50   |
|                   | >400-2,000 MHz  | 10.58/f <sub>M</sub> <sup>0.43</sup>                            | 0.0274/f <sub>M</sub> <sup>0.43</sup>                           | 0.29/f <sub>M</sub> <sup>0.86</sup>                          |
|                   | >2 – 6 GHz      | NA  | NA  | 200  |
|                   | >6 – <300 GHz   | NA  | NA  | 275/f <sub>o</sub> <sup>0.177</sup>                          |
|                   | 300 GHz         | NA  | NA  | 100  |
| General Public    | 0.1-0.233 MHz   | ES  | ES  | NA   |
|                   | >0.233-10 MHz   | ES  | 4.9/f <sub>M</sub>  | NA   |
|                   | >10-30 MHz      | 671/f <sub>M</sub> <sup>0.7</sup>                               | 4.9/f <sub>M</sub>  | NA   |
|                   | >30-400 MHz     | 62  | 0.163   | 10   |
|                   | >400-2,000 MHz  | 4.72/f <sub>M</sub> <sup>0.43</sup>                             | 0.0123/f <sub>M</sub> <sup>0.43</sup>                           | 0.058/f <sub>M</sub> <sup>0.86</sup>                         |
|                   | >2 – 6 GHz      | NA  | NA  | 40   |
|                   | >6 – <300 GHz   | NA  | NA  | 55/f <sub>o</sub> <sup>0.177</sup>                           |
|                   | 300 GHz         | NA  | NA  | 20   |
